GOTHIC RENAISSANCE

low-carbon aluminum

YKK's Aluminum Alloy Zippers use low-carbon aluminum that is smelted using renewable energy sources, such as hydropower.

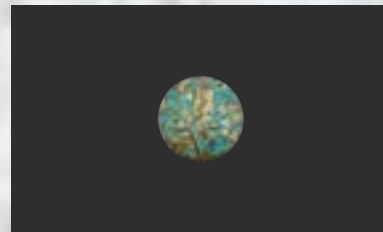

The aluminum smelting process requires a large quantity of electricity and emits different amounts of carbon dioxide depending on the power source used. The emissions of the low-carbon aluminum to be used for this initiative will be less

than 4 metric tons of CO₂ per ton of aluminum ingots produced, as it uses renewable energy as the power source. This significantly reduces CO₂ emissions compared to using electricity generated from fossil fuels such as thermal power.

Through the use of low-carbon aluminum, we are working to reduce greenhouse gas (GHG) emissions while promoting effective resource utilization.
